Problem Statement:

An app that takes a class schedule and gps location to find a restaurant that can get the user food with enough time to get to the next class.

Who is experiencing the problems?

Students new to the college that do not know the area and options available to them.

What is the problem?

Someone who is hungry without much time would have to wait until later if they do not know a place they can go to get food fast.

Where does the problem present itself?

Anywhere someone needs to find a quick bite.

Why does it matter?

With a busy schedule, students would need to hurry when getting food and cannot wait long for food and end up late for their classes.
